

## Lecture 17

[illegible]

## Eggs in pig feces

---

---

---

---

---

---

*Hirynchus hirudinaceus*

Pig ingests beetle, cercariae develops to adult

Adult in pig intestine

Embryos passed with feces of host and ingested by beetle larva

Acanthoblast larva

Acanthoblast

Cercaria (develops as beetle stamens)

## Acanthocephala: Examples

b. *Plagiorhynchus* - Janice  
Moore, CSU

1. infected isopods walk on  
sidewalks, increase transmission  
to starling chicks.

Figure 31.11  
Cytoskeleton of *Plagiorhynchus cylindricus*. (a) Thirty-seven  
days after infection of the pillbug intermediate host; (b) 60 days  
after infection. B, body; L, lumen; P, pharynx; BU, body  
cavity; U, uterus; V, vagina.  
From G. D. Schmidt and G. W. Olsen, "Life cycle and development of  
*Plagiorhynchus cylindricus* (Owen, 1935) (Trematode, 1935) an acanthocephalan  
parasite of birds" in J. Parasitol. 70:723-730. Copyright © 1984 Journal of  
Parasitology. Reprinted by permission.

---

---

---

---

---

## Acanthocephala: Characteristics

c. An  
Undescribed  
species in  
Montezuma Well.

1. Turns  
amphipods orange
2. May enhance  
transmission to  
final avian host  
(ducks).

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

Figure 31.9  
Life cycle of a representative acanthocephalan, *Leptorhynchoides thecauri* from the green sunfish, *L. thecauri*. Eggs have a fibrous coat that entangles and functions to entangle eggs in vegetation eaten by the amphipod intermediate host. Small fishes can serve as paratenic hosts in this system.

Acanthocephalans in intestinal mucosa of Great Lakes salmonid fish.

## Acanthocephala: Sexual Dimorphism

1. Separate sexes,  
males < females
2. males compete with each other for access to mates.
  - a. competition includes cementing other males up
  - b. may favor early maturation - mature 1st, be cementer.

---

---

---

---

---

---

---

---

## Acanthocephala: Sexual Dimorphism

3. females produce many eggs - dispersed in feces to be picked up by intermediate hosts
  - a. larger females produce more eggs
  - b. may favor longer period of growth, larger size at maturity.

---

---

---

---

---

---

---

---

## Acanthocephala: Sexual Dimorphism

4. Thus, *sexual dimorphism* appears to be a consequence of two factors:

1. Selection favoring rapid maturation in males.
2. Selection favoring large size in females.
  - b. Result: large females, small males.

Figure 31.3  
Oncophorus as an example, illustrating basic acanthocephalan morphology. (a) Female; (b) male.

## Phylum Nematomorpha

### General Characteristics

1. Weird, once thought to represent spontaneous generation.
  - a. Adults occur in horse troughs.
  - b. Attempts to revitalize horsehairs failed.

---

---

---

---

---

---

---

---

## Phylum Nematomorpha

### General Characteristics

2. Fairly abundant - 230 spp
3. Body form
  - a. **Similar to nematodes**
1. thick cuticle must be molted.

---

---

---

---

---

---

---

---

## Nematomorpha: Characteristics

2. Longitudinal muscles.
3. No ciliated structures.

---

---

---

---

---

---

---

---

## Nematomorpha: Characteristics

Dissimilar to Nematodes.

1. Do not show consistency in cell number (eutely).
2. Pseudocoel filled with mesenchyme.
3. Rudimentary digestive system.

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Phylum

## Nematomorpha

Dissimilar to Nematodes.

- a. nutrients absorbed from body of insect host.
3. No excretory system
4. No specialized genital system - cloacas in both sexes.

---

---

---

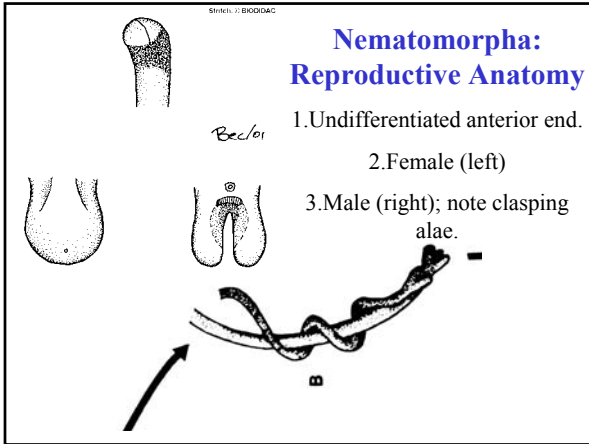

---

---

---

---

---

---

---

---

---

---

---

---

---

**Nematomorpha: Life Cycle**

a. Adults develop in bodies of insects.

1. Cause hosts to seek water, once entering, they explode.

2. Separate sexes mate in water.

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Nematomorpha: Life Cycle

a. Females lay eggs that wrap around aquatic vegetation.

3. Eggs hatch, larvae remain free living for only a few days.

---

---

---

---

---

---

---

---

## Nematomorpha: Life Cycle

4. Larvae ingested by host- when insects feed or drink near water.

a. Use hooked proboscis to imbed in tissues

---

---

---

---

---

---

---

---

## Nematomorpha: Life Cycle

b. If unsuitable host ingests, will encyst and wait for intermediate host to be ingested by suitable host.

1. Beetle -> mantid

---

---

---

---

---

---

---

---

## Nematomorpha: Other Hosts

2. Can also inhabit annelids, molluscs, crustaceans, humans
5. Mature worm develops beneath skin.

Horsehair (Gordian) Worm

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

Figure 5.1  
Life Cycle of *Paragordius varius*. (A) First-instar *Gordius pennsylvanicus*. (B) male *Paragordius varius* coiled around a female during mating. (C) female depositing egg strings. (D) external surface of egg string showing developing and emerging larvae. (E) prepupal juvenile before entering host.

## Phylum Nematomorpha

Historical Notes:

- a. Example: *Gordius* after the Gordian Knot.
1. intricate knot tied by King Gordius of Phrygia
  - a. whoever untied it would be King of Asia.

## Phylum Nematomorpha

b. Alexander cut it with his sword and became King of Phrygia

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Phylum Nemata

A.k.a., Phylum Nematoda

### General characteristics

1. widely distributed and unbelievably abundant!

---

---

---

---

---

---

---

---

## Phylum Nemata

Nematodes are:

- Free-living, commensal, parasitic.
- Of tremendous economic importance.
- The number of species defies description, evidently because their body form *preadapts* them to so many ecological niches.

---

---

---

---

---

---

---

---

"If all the matter in the universe except the nematodes were swept away, our world would still be dimly recognizable, and if, as disembodied spirits, we could then investigate it, we should find its mountains, hills, vales, rivers, lakes and oceans represented by a film of nematodes. The location of towns would be decipherable, since for every massing of human beings there would be a corresponding massing of certain nematodes. Trees would still stand in ghostly rows representing our streets and highways. The location of the various plants and animals would still be decipherable, and, had we sufficient knowledge, in many cases even their species could be determined by an examination of their erstwhile nematode parasites."

N.A. Cobb 1966.

---

---

---

---

---

---

---

### Box Four

#### Characteristics of the Phylum Nematoda

1. Triploblastic, bilateral, vermiform, unsegmented, pseudocoelomates
2. Body round in cross section and covered by a layered cuticle; growth in juveniles usually accompanied by molting
3. With unique cephalic sense organs called amphids; some have caudal sense organs called phasmids
4. Gut complete; mouth surrounded by six lips bearing sense organs (often reduced to three lips, or to a simple ring)
5. Most with unique excretory system, comprised of one or two renette cells or a set of collecting tubules
6. Without special circulatory or gas exchange structures
7. Body wall has only longitudinal muscles
8. Longitudinal muscle cells connected to longitudinal nerve cords by unique muscle arms
9. Epidermis produced into longitudinal cords housing nerve cords
10. Gonochoresitic
11. Inhabit marine, freshwater, and terrestrial environments; some are free-living and some parasitic

---

---

---

---

---

---

---

---

# Phylum Nemata

## Body form

- Slender, elongate, w/tapered ends, - good for interstitial environments.
- Mostly small; < 3mm with some exceptions (20-30 cm *Ascaris*).

---

---

---

---

---

---

---

---

## Nemata: Body Ends

- Anterior is radially symmetrical - 3 (or 6) lips.

a. Suggests possible sessile ancestor.

b. Sensory papillae.

c. Chemosensory structures - **amphids**

- Well-developed in free-living forms.

---

---

---

---

---

---

---

---

---

---

---

---

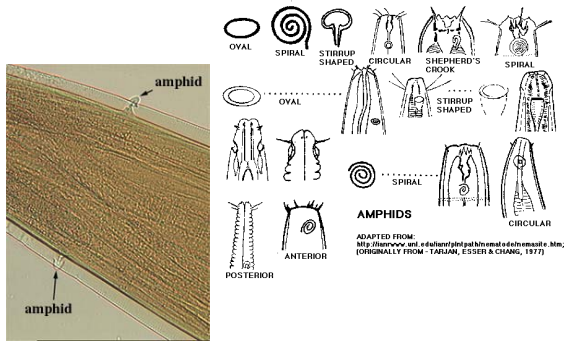

---

---

---

---

## Nemata: Amphids

---

---

---

---

---

---

---

---

## Nemata: Body Ends

2. Posterior – often with adhesive structures.
- a. Some species with other sensory structures – **phasmids**
  1. Well-developed in parasites.

---

---

---

---

---

---

---

---
